Nigeria and Trunz Water Systems to Tackle Cholera

70% of the population of Africa's most populated country NIGERIA, still fetch their water from mud puddles, contaminated rivers, streams and lakes.

According to UN statistics, 1,500 people have died, and another 40,000 infected from this water borne disease CHOLERA since January of this year.

This is the worst outbreak since 1991 when 7,654 people died in Nigeria from cholera, according to WHO statistics.

The Federal Government of Nigeria are now finalising plans to install autonomous water filtration units, powered by solar and wind power, into rural communities to halt and eradicate this deadly disease.

TRUNZ Water Systems have their units operating in 35 countries, from the jungles of Venezuela, to the deserts of Arabia, requiring no chemicals or diesel for generators and providing a green and sustainable solution for remote communities of pure clean drinking water, even beyond the guidelines laid down by the World Health Organisation.

TRUNZ Water Systems of Switzerland is proud to announce its association with the Federal Ministry of Water and the Federal Government of Nigeria in taking this pro-active action to eradicate the disease and for being one of the first major countries to take such a quantum leap in meeting one of the major millennium goals.
